## Partitions

RS

Owned by [Ryan Seaman](#)

Last updated: Mar 28, 2025 · 4 people viewed

Partitions group nodes into logical (possibly overlapping) sets. At LIBR, we put all compute nodes into two partitions: c3 and c3\_short.

|          | Partition Priority | Time Limits (Max. time needed for script to run) | Memory Limits (Max. amount of RAM needed for script to run)          | Preempted by* | Notes                                                                                                                                                                                                                                                                      |
|----------|--------------------|--------------------------------------------------|----------------------------------------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c3       | 100000             | Default: 24 hours<br>Maximum: 168 hours          | Default: 6000MB/core (6GB/core)<br>Maximum: 12000MB/core (12GB/core) | c3_short      |                                                                                                                                                                                                                                                                            |
| c3_short | 200000             | Default: 9 hours<br>Maximum: 9 hours             | Default: 6000MB/core (6GB/core)<br>Maximum: 12000MB/core (12GB/core) | none          | This queue has over subscription forced. This means if all compute resources are consumed by jobs in any partition and any of those jobs have over subscription enabled (like any job in this partition), the jobs will split the resources and execute on the same cores. |
