Job Management Commands

Owned by Ryan Seaman ...

Last updated: Mar 28, 2025 · 1 min read · 3 people viewed

srun

If you have a job you need to interact with, or a script that can be run without any environment setup, then use the **srun** command. SLURM uses its default running parameters unless you specify what resources you need.

```
1 srun <script>
2 srun --ntasks <number of tasks> --cpus-per-task <number of cpus per task> --nodes <numb
```

Examples:

```
1 [user@submit0 ~]$ srun ./helloWorld.sh
2 Hello World
3 [user@submit0 ~]$ srun --ntasks 1 --cpus-per-task 1 --nodes 1 ./helloWorld.sh
4 Hello World
```

For additional information refer to the official documentation at: [Slurm Workload Manager - srun](#)

You may also get an interactive shell on one of the compute nodes:

```
1 [jappleseed@submit0 ~]$ srun --pty bash
2 [jappleseed@compute305 ~]$ #Now you are on a compute node
```

sbatch

If you have a batch of jobs or a job that requires some more environment setup, then use the **sbatch** command along with a job submission file.

```
1 sbatch < /path/to/submission/file.ssub
```

Example:

```
1 [user@submit0 ~]$ sbatch < ./test.ssub
2 Submitted batch job 199303
```

For additional information refer to the official documentation at: [Slurm Workload Manager - sbatch](#)

scancel

Use the **scancel** command to cancel pending and running jobs. This command does not output anything to the terminal.

```
1 scancel <job number>           //cancels the specified job
2 scancel -u <username>          //cancels all jobs for the specified user
3 scancel -t PENDING -u <username> //cancels all pending jobs for the specified user
```

For additional information refer to the official documentation at: [Slurm Workload Manager - scancel](#)
